NETRA DIALER

Official Business Identity Lock & Verified Business Caller ID

Technical requirements for verified business identity, Voice AI greetings, and outbound caller identification

Prepared for: Prayagi Store & Services

Document purpose: Define non-negotiable identity-security rules and realistic caller-ID delivery requirements for the Netra Dialer Android application.

CORE RULE	TECHNICAL CONSEQUENCE
Business identity comes from an authoritative, verified registration record.	Ordinary editable profile fields must never override the verified legal name.
Business registration number alone does not prove ownership or authority.	Verify the applicant's authorization to represent the business before activation.
Caller ID delivery is controlled by the supported telephony path and recipient ecosystem.	Never promise the name will appear on every recipient's phone.

Scope

This document consolidates the two requirements supplied: (1) Official Business Identity Lock for the Voice AI Business Assistant, and (2) Verified Business Caller ID for outgoing calls. It is written as an implementation-ready specification and master-prompt addendum.

Important platform limitation: Android's default-dialer role alone cannot guarantee cellular call recording, AI handling of ordinary SIM-call audio, or the display of a business name on every recipient device. Use documented Android APIs and authorized carrier/telephony integrations, and report actual capability/status honestly.

1. Official Business Identity Lock

Purpose

The publicly announced business name used by Netra Dialer must originate from an authoritative, successfully verified government registration record. A user must not be able to change that identity through ordinary app settings.

1.1 Verification workflow

STEP	STAGE	REQUIREMENT
1	Registration submitted	Accept GSTIN or Udyam Registration Number as alternative verification routes.
2	Authoritative verification	Verify the record through an official or legally authorized source. Syntax validation alone is insufficient.
3	Authorization check	Verify that the applicant is authorized to represent the registered business; possession of another business's registration number is not authorization.
4	Identity lock	Store the verified legal name and its source separately from editable business profile fields.
5	Activate Business AI	Activate branded answering only after registration, authorization, required consent, configuration, and supported call routing are all valid.

1.2 Official-name and trade-name policy

• Default to the verified legal name from the authoritative registration record.

• A trade name may be announced only when it is independently verified through an authorized source and platform policy permits it.

• Keep the identity service separate from editable descriptions, FAQs, service lists, business hours, and AI conversation settings.

• An uploaded screenshot or user-entered name alone must never authorize a new official identity.

1.3 Name-change and status rules

SITUATION	NETRA DIALER ACTION
Valid registration and applicant authorization verified	Lock the verified identity and allow activation when all other prerequisites are satisfied.
Another business's GSTIN/Udyam number submitted	Reject activation if applicant authorization cannot be established.
User manually edits the displayed name	Do not change the locked identity; retain the edit only as a non-authoritative internal description if appropriate.
Government record name changes	Start re-verification. Keep the old identity only while its record and authorization remain valid; otherwise suspend branded answering.
Re-verification and authorization succeed	Activate the newly verified identity and record the audit event.
Registration is invalid, cancelled, unverifiable, or inconsistent	Block or suspend Business AI activation until resolved.

1.4 Required audit trail

Log verification and re-verification timestamps, source, matched identity, status transitions, activation/suspension events, and failure reasons. Protect registration identifiers and avoid retaining unnecessary sensitive data.

2. Verified Business Caller ID

Purpose

When a verified business owner makes an outgoing call, Netra Dialer should attempt to present the approved business identity through an authorized caller-identification route. Display on the recipient's device is not guaranteed by the app alone.

2.1 Supported integration paths

Normal SIM calls

Use supported carrier-level business caller identification or a compatible caller-ID service where officially available. Recipient carrier, dialer, region, and service support can affect display.

Business telephony / VoIP

Use a documented provider that supports verified outbound caller ID. The provider must authorize the number and business identity, and its regional availability, eligibility, and compliance requirements must be checked.

2.2 Caller ID rules

• Link each verified business profile only to an authorized outbound number or supported business telephony identity.

• Verify the right to use the phone number independently from business registration.

• Use only the approved official business identity; block arbitrary caller-name editing and unauthorized number substitution.

• Allow the owner to select Business Calling or Personal Calling only where the underlying telephony integration supports the distinction.

• If verified caller ID cannot be delivered, continue normal authorized calling without spoofing another identity.

• Keep caller-ID configuration separate from the Voice AI answering schedule, while allowing both to use the same verified business profile.

2.3 Truthful status reporting

STATUS	MEANING
Business identity verified	Registration and approved business identity have passed the identity workflow.
Phone number verified	The user has demonstrated authorization to use the outbound number.
Caller-ID registration pending	The selected carrier/provider has not completed approval.
Provider approved	The provider has accepted the configuration; recipient-side display may still vary.
Provider rejected / unavailable	Do not claim successful delivery; show the actual failure and permitted next step.
Recipient display not guaranteed	Recipient carrier, dialer, and caller-ID service may determine what appears.

3. Master Development Prompt Addendum

Paste the following module into the Netra Dialer master development prompt.

OFFICIAL BUSINESS IDENTITY LOCK — NON-NEGOTIABLE

1. Accept GSTIN or Udyam Registration Number as alternative verification routes.
2. Verify registration through an official or legally authorized source; syntax validation alone is insufficient.
3. Verify that the applicant is authorized to represent the registered business.
4. Store the verified legal name and verification source separately from user-editable profile fields.
5. Never allow ordinary profile settings to overwrite, rename, impersonate, or substitute the verified business identity.
6. Use the verified legal name for AI greetings by default. Use a trade name only if independently verified and allowed by platform policy.
7. To change the announced official name, require an authoritative government-record update, then repeat identity and authorization checks.
8. Never activate a new name based only on user input, an uploaded screenshot, or an unverified document.
9. While re-verification is pending, retain the previous identity only while its registration and authorization remain valid; otherwise suspend branded answering.
10. If registration is invalid, cancelled, unverifiable, or inconsistent, suspend Business AI activation.
11. Maintain an audit trail for verification, re-verification, status changes, and activation events.
12. Fail closed when identity or authorization cannot be verified.

VERIFIED BUSINESS CALLER ID — OUTGOING CALLS

1. Link each verified business profile to an authorized outbound phone number or supported business telephony identity.
2. Verify number ownership/authorization separately from business registration.
3. Use only the official verified identity approved by the identity-verification module.
4. Support normal SIM caller identification only where a compatible carrier/service supports it.
5. Support documented business telephony/VoIP integrations with verified outbound caller ID.
6. Prevent arbitrary caller-name editing, unauthorized number substitution, spoofing, and impersonation.
7. Permit business/personal calling selection only where the underlying telephony integration supports it.
8. Do not claim Android's default-dialer role alone can force the name to appear on every recipient device.
9. Report actual status: identity verified, number verified, provider pending/approved/rejected, and recipient display not guaranteed.
10. If verified caller ID cannot be delivered, continue authorized normal calling without spoofing an identity.
11. Keep caller-ID configuration separate from Voice AI answering schedule, while reusing the same verified business profile.
12. Add tests for authorized numbers, rejected identities, expired verification, provider failures, and business/personal separation.

ACCEPTANCE CRITERIA
- A local UI label is not proof of successful caller-ID delivery.
- Verify successful configuration through the selected carrier/telephony provider and test on recipient devices.
- Do not fabricate integrations, approvals, test results, or delivery guarantees.
- Use documented APIs and fail closed on identity or authorization uncertainty.

4. Acceptance Checklist

☐ GSTIN/Udyam record is checked using an official or legally authorized route.

☐ Applicant authority to represent the business is independently verified.

☐ Verified legal name is stored separately from editable profile fields.

☐ Name changes require official record update and successful re-verification.

☐ Invalid, cancelled, or unverifiable registrations block branded answering.

☐ Outbound number authorization is checked separately.

☐ Caller ID uses only the approved identity and supported provider/carrier route.

☐ Provider approval is not misrepresented as guaranteed recipient display.

☐ Business and personal calling are separated where technically supported.

☐ Audit trail and failure handling are implemented.

☐ Automated tests cover rejection, expiry, provider failure, and re-verification.

Implementation note

The document specifies product behavior, not proof that any particular GST/Udyam API or carrier-level caller-ID service is currently available to the project. The development team must verify access, terms, regional support, cost, and technical capability before selecting an integration.
